Target Details	At the nuclear envelope, the nuclear lamina and heterochromatin are adjacent to the inner nuclear membrane. This protein binds DNA and is a component of heterochromatin. This protein also can bind lamin B receptor, an integral membrane protein found in the inner nuclear membrane. The dual binding functions of the encoded protein may explain the association of heterochromatin with the inner nuclear membrane. Two transcript variants encoding the same protein but differing in the 5 UTR, have been found for this gene.
