Immunocytochemistry analysis of CSBPA010403OA12me1HU diluted at 1:30 and staining in Hela cells performed on a Leica BondTM system. The cells were fixed in $4 \%$ formaldehyde, permeabilized using 0.2\% Triton X-100 and blocked with $10 \%$ normal goat serum 30 min at RT. Then primary antibody ( $1 \%$ BSA) was incubated at $4^{\circ} \mathrm{C}$ overnight. The primary is detected by a biotinylated secondary antibody and visualized using an HRP conjugated SP system.

Chromatin Immunoprecipitation Hela $\left(4^{*} 10^{6}\right)$ were treated with Micrococcal Nuclease, sonicated, and immunoprecipitated with $5 \mu \mathrm{~g}$ antiHIST1H2BC (CSB-PA010403OA12me1HU) or a control normal rabbit IgG. The resulting ChIP DNA was quantified using real-time PCR with primers against the $\beta$-Globin promoter.
