Target Details	<p>The oncogene BCL2 is a membrane protein that blocks a step in a pathway leading to apoptosis or programmed cell death. This protein binds to BCL2 and is referred to as BCL2-associated athanogene. It enhances the anti-apoptotic effects of BCL2 and represents a link between growth factor receptors and anti-apoptotic mechanisms. At least three protein isoforms are encoded by this mRNA through the use of a non-AUG (CUG) start site, and alternative, downstream, AUG translation initiation sites.</p>
