<b>Target Details</b>	This protein contains RNA recognition motif found in a variety of RNA binding proteins, including various hnRNP proteins, proteins implicated in regulation of alternative splicing, and protein components of snRNPs. In vitro studies showed that the rat homolog bound to RNA homopolymers, with a preference for G and U polyribonucleotides. This gene is part of a gene cluster on chromosome Xp11.23, and its 3 end lies within 20 kb upstream of UBE1. Two transcript variants encoding different isoforms have been identified for this gene.
