<b>Target Names</b>	RXRA
<b>Target Details</b>	Retinoid X receptors (RXRs) and retinoic acid receptors (RARs), are nuclear receptors that mediate the biological effects of retinoids by their involvement in retinoic acid-mediated gene activation. These receptors exert their action by binding, as homodimers or heterodimers, to specific sequences in the promoters of target genes and regulating their transcription. This protein is a member of the steroid and thyroid hormone receptor superfamily of transcriptional regulators.
