Target Names	SLC12A5
Target Details	K-Cl cotransporters are proteins that lower intracellular chloride concentrations below the electrochemical equilibrium potential. This protein is an integral membrane K-Cl cotransporter that can function in either a net efflux or influx pathway, depending on the chemical concentration gradients of potassium and chloride. The encoded protein can act as a homomultimer, or as a heteromultimer with other K-Cl cotransporters, to maintain chloride homeostasis in neurons. Alternative splicing results in two transcript variants encoding different isoforms.
