Pig secretory immunoglobulin A(sIgA) ELISA Kit

Catalog Number. CSB-E12063p

For the quantitative determination of pig secretory immunoglobulin A (sIgA) concentrations in serum, plasma, cell culture supernates, tissue homogenates.

This package insert must be read in its entirety before using this product.

If You Have Problems

Technical Service Contact information

Fax: 86-27-87196150
Email: tech@cusabio.com
Web: www.cusabio.com

In order to obtain higher efficiency service, please ready to supply the lot number of the kit to us (found on the outside of the box).
PRINCIPLE OF THE ASSAY

This assay employs the competitive inhibition enzyme immunoassay technique. The microtiter plate provided in this kit has been pre-coated with pig sIgA. Standards and samples are pipetted into the wells with a Horseradish Peroxidase (HRP) conjugated antibody specific for pig sIgA. Following a wash to remove any unbound reagent, a substrate solution is added to the wells and color develops in opposite to the amount of pig sIgA in samples. The color development is stopped and the intensity of the color is measured.

DETECTION RANGE

0.15 μg/ml-37.5 μg/ml.

SENSITIVITY

The minimum detectable dose of pig sIgA is typically less than 0.15 μg/ml. The sensitivity of this assay, or Lower Limit of Detection (LLD) was defined as the lowest pig sIgA concentration that could be differentiated from zero.

SPECIFICITY

This assay has high sensitivity and excellent specificity for detection of pig sIgA. No significant cross-reactivity or interference between pig sIgA and analogues was observed.

Note: Limited by current skills and knowledge, it is impossible for us to complete the cross-reactivity detection between pig sIgA and all the analogues, therefore, cross reaction may still exist.
**PRECISION**

*Intra-assay Precision (Precision within an assay): CV%<8%*
Three samples of known concentration were tested twenty times on one plate to assess.

*Inter-assay Precision (Precision between assays): CV%<10%*
Three samples of known concentration were tested in twenty assays to assess.

**LIMITATIONS OF THE PROCEDURE**

- FOR RESEARCH USE ONLY. NOT FOR USE IN DIAGNOSTIC PROCEDURES.
- The kit should not be used beyond the expiration date on the kit label.
- Do not mix or substitute reagents with those from other lots or sources.
- If samples generate values higher than the highest standard, dilute the samples with Sample Diluent and repeat the assay.
- Any variation in Sample Diluent, operator, pipetting technique, washing technique, incubation time or temperature, and kit age can cause variation in binding.
- This assay is designed to eliminate interference by soluble receptors, binding proteins, and other factors present in biological samples. Until all factors have been tested in the Immunoassay, the possibility of interference cannot be excluded.

*Provided this is within the expiration date of the kit.*
OTHER SUPPLIES REQUIRED

- Microplate reader capable of measuring absorbance at 450 nm, with the correction wavelength set at 540 nm or 570 nm.
- An incubator which can provide stable incubation conditions up to 37°C±0.5°C.
- Squirt bottle, manifold dispenser, or automated microplate washer.
- Absorbent paper for blotting the microtiter plate.
- 100ml and 500ml graduated cylinders.
- Deionized or distilled water.
- Pipettes and pipette tips.
- Test tubes for dilution.

PRECAUTIONS

The Stop Solution provided with this kit is an acid solution. Wear eye, hand, face, and clothing protection when using this material.
SAMPLE COLLECTION AND STORAGE

- **Serum**  Use a serum separator tube (SST) and allow samples to clot for two hours at room temperature or overnight at 4°C before centrifugation for 15 minutes at 1000 x g. Remove serum and assay immediately or aliquot and store samples at -20°C or -80°C. Avoid repeated freeze-thaw cycles.

- **Plasma**  Collect plasma using EDTA, or heparin as an anticoagulant. Centrifuge for 15 minutes at 1000 x g at 2-8°C within 30 minutes of collection. Assay immediately or aliquot and store samples at -20°C or -80°C. Avoid repeated freeze-thaw cycles.

- **Cell Culture Supernates**  Remove particulates by centrifugation for 15 minutes at 1000 x g, 2 - 8°C and assay immediately or aliquot and store samples at -20°C or -80°C. Avoid repeated freeze-thaw cycles.

- **Tissue Homogenates**  100mg tissue was rinsed with 1XPBS, homogenized in 1 ml of 1X PBS and stored overnight at -20°C. After two freeze-thaw cycles were performed to break the cell membranes, the homogenates were centrifuged for 5 minutes at 5000 x g, 2 - 8°C. The supernate was removed and assayed immediately. Alternatively, aliquot and store samples at -20°C or -80°C. Centrifuge the sample again after thawing before the assay. Avoid repeated freeze-thaw cycles.

SAMPLE PREPARATION

Serum and plasma samples require a 1000-fold dilution into Sample Diluent. The suggested 1000-fold dilution can be achieved by adding 5μl sample to 95μl of Sample Diluent first, then complete the 1000-fold dilution by adding 5μl of this solution to 245μl of Sample Diluent. The recommended dilution factor is for reference only. The optimal dilution factor should be determined by users according to their particular experiments.
Note:
1. CUSABIO is only responsible for the kit itself, but not for the samples consumed during the assay. The user should calculate the possible amount of the samples used in the whole test. Please reserve sufficient samples in advance.
2. Samples to be used within 5 days may be stored at 2-8°C, otherwise samples must be stored at -20°C (≤1 month) or -80°C (≤2 month) to avoid loss of bioactivity and contamination.
3. Grossly hemolyzed samples are not suitable for use in this assay.
4. If the samples are not indicated in the manual, a preliminary experiment to determine the validity of the kit is necessary.
5. Please predict the concentration before assaying. If values for these are not within the range of the standard curve, users must determine the optimal sample dilutions for their particular experiments.
6. Tissue or cell extraction samples prepared by chemical lysis buffer may cause unexpected ELISA results due to the impacts of certain chemicals.
7. Owing to the possibility of mismatching between antigen from other resource and antibody used in our kits (e.g., antibody targets conformational epitope rather than linear epitope), some native or recombinant proteins from other manufacturers may not be recognized by our products.
8. Influenced by the factors including cell viability, cell number and also sampling time, samples from cell culture supernatant may not be detected by the kit.
9. Fresh samples without long time storage are recommended for the test. Otherwise, protein degradation and denaturalization may occur in those samples and finally lead to wrong results.
REAGENT PREPARATION

Note:

● Kindly use graduated containers to prepare the reagent. Please don’t prepare the reagent directly in the Diluent vials provided in the kit.
● Bring all reagents to room temperature (18-25°C) before use for 30min.
● To minimize imprecision caused by pipetting, use small volumes and ensure that pipettors are calibrated. It is recommended to suck more than 10μl for once pipetting.
● Distilled water is recommended to be used to make the preparation for reagents. Contaminated water or container for reagent preparation will influence the detection result.

Wash Buffer (1x)- If crystals have formed in the concentrate, warm up to room temperature and mix gently until the crystals have completely dissolved. Dilute 20 ml of Wash Buffer Concentrate (25 x) into deionized or distilled water to prepare 500 ml of Wash Buffer (1 x).
ASSAY PROCEDURE

Bring all reagents and samples to room temperature before use. Centrifuge the sample again after thawing before the assay. It is recommended that all samples and standards be assayed in duplicate.

1. Prepare all reagents and samples as directed in the previous sections.
2. Determine the number of wells to be used and put any remaining wells and the desiccant back into the pouch and seal the ziploc, store unused wells at 4°C.
3. Set a Blank well without any solution.
4. Add 50μl of Standard or Sample per well. Standard need test in duplicate.
5. Add 50μl of HRP-conjugate to each well immediately (not to Blank well).
6. Mix well and then incubate for 40 minutes at 37°C. A plate layout is provided to record standards and samples assayed.
7. Aspirate each well and wash, repeating the process four times for a total of five washes. Wash by filling each well with Wash Buffer (200μl) using a squirt bottle, multi-channel pipette, manifold dispenser, or autowasher, and let it stand for 2 minutes, complete removal of liquid at each step is essential to good performance. After the last wash, remove any remaining Wash Buffer by aspirating or decanting. Invert the plate and blot it against clean paper towels.
8. Add 90μl of TMB Substrate to each well. Incubate for 20 minutes at 37°C. Protect from light.
9. Add 50μl of Stop Solution to each well, gently tap the plate to ensure thorough mixing.
10. Determine the optical density of each well within 5 minutes, using a microplate reader set to 450 nm. If wavelength correction is available, set to 540 nm or 570 nm. Subtract readings at 540 nm or 570 nm from the readings at 450 nm. This subtraction will correct for optical imperfections in the plate. Readings made directly at 450 nm without correction may be higher and less accurate.

*Samples may require dilution. Please refer to Sample Preparation section.
Note:
1. The final experimental results will be closely related to validity of the
   products, operation skills of the end users and the experimental
   environments.
2. Samples or reagents addition: Please use the freshly prepared Standard.
   Please carefully add samples to wells and mix gently to avoid foaming. Do
   not touch the well wall as possible. For each step in the procedure, total
   dispensing time for addition of reagents or samples to the assay plate
   should not exceed 10 minutes. This will ensure equal elapsed time for
   each pipetting step, without interruption. Duplication of all standards and
   specimens, although not required, is recommended. To avoid
   cross-contamination, change pipette tips between additions of each
   standard level, between sample additions, and between reagent additions.
   Also, use separate reservoirs for each reagent.
3. Incubation: To ensure accurate results, proper adhesion of plate sealers
   during incubation steps is necessary. Do not allow wells to sit uncovered
   for extended periods between incubation steps. Once reagents have been
   added to the well strips, DO NOT let the strips DRY at any time during the
   assay. Incubation time and temperature must be observed.
4. Washing: The wash procedure is critical. Complete removal of liquid at
   each step is essential to good performance. After the last wash, remove
   any remaining Wash Solution by aspirating or decanting and remove any
   drop of water and fingerprint on the bottom of the plate. Insufficient
   washing will result in poor precision and falsely elevated absorbance
   reading. When using an automated plate washer, adding a 30 second
   soak period following the addition of wash buffer, and/or rotating the plate
   180 degrees between wash steps may improve assay precision.
5. Controlling of reaction time: Observe the change of color after adding TMB
   Substrate (e.g. observation once every 10 minutes), TMB Substrate
   should change from colorless or light blue to gradations of blue. If the color
   is too deep, add Stop Solution in advance to avoid excessively strong
   reaction which will result in inaccurate absorbance reading.
6. TMB Substrate is easily contaminated. TMB Substrate should remain
   colorless or light blue until added to the plate. Please protect it from light.
7. Stop Solution should be added to the plate in the same order as the TMB
   Substrate. The color developed in the wells will turn from blue to yellow
   upon addition of the Stop Solution. Wells that are green in color indicate
   that the Stop Solution has not mixed thoroughly with the TMB Substrate..
ASSAY PROCEDURE SUMMARY

1. Prepare reagents and samples as instructed.

2. Set a Blank well without any solution.

3. Add 50μl standard or sample to each well.

4. Add 50μl HRP-conjugate to each well (not to Blank well).

5. Incubate for 40 minutes at 37°C.

6. Aspirate and wash 5 times.

7. Add 90μl TMB Substrate to each well. Incubate 20 minutes at 37°C. Protect from light.

8. Add 50μl Stop Solution to each well. Read at 450nm within 5 minutes.

*Samples may require dilution. Please refer to Sample Preparation section.
CALCULATION OF RESULTS

Using the professional soft "Curve Expert" to make a standard curve is recommended, which can be downloaded from our web.

Average the duplicate readings for each standard and sample and subtract the average optical density of Blank.

Create a standard curve by reducing the data using computer software capable of generating a four parameter logistic (4-PL) curve-fit. As an alternative, construct a standard curve by plotting the mean absorbance for each standard on the x-axis against the concentration on the y-axis and draw a best fit curve through the points on the graph. The data may be linearized by plotting the log of the pig sIgA concentrations versus the log of the O.D. and the best fit line can be determined by regression analysis. This procedure will produce an adequate but less precise fit of the data.

If samples have been diluted, the concentration read from the standard curve must be multiplied by the dilution factor.
